

LOS ASSIGNMENT – 01

Linux Operating System

1. What If There Were No Operating System?

An operating system is system software that acts as an interface between users, application and hardware. Without an operating system, a computer would be very difficult to use because users have to interact directly with the hardware.

Problems Without OS and Solutions With OS

Problem Without OS	Solution Provided by OS
Hardware must be controlled manually	OS manages hardware resources
Programs cannot be easily executed	OS manages process execution
Files are difficult to create and manage	OS provides file systems and file-management tools
Devices are difficult to access	OS uses device drivers
No proper user security	OS provides users, groups and permissions

Without OS vs With OS Comparison

Feature	Without OS	With OS
Running program	Very difficult	Easy
File management	Manual and complicated	Simple commands and file systems
Memory management	Manual	Automatically managed
Security	Very limited	Authentication and permissions
Networking	Direct hardware-level control	Built-in networking support

Features of Linux Command

Feature 1: File management

```
(kali㉿kali)-[~]  
$ ls  
Desktop Documents Downloads Music Pictures Projects Public Templates Videos  
  
(kali㉿kali)-[~]  
$ mkdir LinuxLab  
  
(kali㉿kali)-[~]  
$ cd LinuxLab  
  
(kali㉿kali)-[~/LinuxLab]  
$ touch file1.txt  
  
(kali㉿kali)-[~/LinuxLab]  
$ echo "Linux is Operating System" > file1.txt  
  
(kali㉿kali)-[~/LinuxLab]  
$ cat file1.txt  
Linux is Operating System  
  
(kali㉿kali)-[~/LinuxLab]  
$
```

Linux provides commands for creating directories, creating files, writing data, and displaying file contents.

Feature 2: Process Management

```
(kali㉿kali)-[~/LinuxLab]  
$ sleep 100 &  
[1] 15223  
  
(kali㉿kali)-[~/LinuxLab]  
$ ps  
  PID TTY          TIME CMD  
  2613 pts/0        00:00:01 zsh  
  15223 pts/0        00:00:00 sleep  
  15260 pts/0        00:00:00 ps  
  
(kali㉿kali)-[~/LinuxLab]  
$
```

Linux creates and manages processes and allows users to view running processes.

Feature 3: File Permissions

```
(kali㉿kali)-[~/LinuxLab]
$ touch secure.txt

(kali㉿kali)-[~/LinuxLab]
$ ls -l secure.txt
-rw-rw-r-- 1 kali kali 0 Aug 13 19:06 secure.txt

(kali㉿kali)-[~/LinuxLab]
$ chmod 600 secure.txt

(kali㉿kali)-[~/LinuxLab]
$ ls -l secure.txt
-rw----- 1 kali kali 0 Aug 13 19:06 secure.txt

(kali㉿kali)-[~/LinuxLab]
$
```

chmod 600 gives the owner read and write permission while preventing access by other users.

Feature 4: Memory Management

```
(kali㉿kali)-[~/LinuxLab]
$ free -h
              total        used        free      shared  buff/cache   available
Mem:          1.9Gi         852Mi         379Mi         24Mi         931Mi         1.1Gi
Swap:          953Mi           0B         953Mi
```

This command displays information about memory usage.

2. Imagine your team is setting up a cybersecurity laboratory. Explore at least five Linux distributions relevant to cybersecurity and recommend suitable distributions for different roles such as penetration testing, digital forensics, privacy, and security monitoring. Present your findings creatively as a comparison chart, poster, infographic, or “OS selection guide.”

Linux Distribution	Main Purpose	Recommended Role
Kali Linux	Penetration testing and security assessment	Penetration Testing
Parrot Security OS	Security testing and privacy	Ethical Hacking and Security Research
Tails	Privacy and anonymity	Privacy
CAINE	Digital forensics	Digital forensics

REMnux	Malware analysis	Malware analysis
Security Onion	Network security monitoring	SOC and Security Monitoring

1. Kali Linux

Kali Linux is designed for penetration testing and security auditing. It includes tools such as Nmap, Metasploit, Wireshark, Burp Suite, etc.

Recommended for: Penetration Testing and ethical hacking.

2. Parrot Security OS

Parrot Security OS provides penetration-testing, security, privacy and development tools in a lightweight environment.

Recommended for: Ethical hacking, security research and privacy.

3. Tails

Tails is a privacy-focused Linux distribution that uses the Tor network and is designed to minimize traces on the computer.

Recommended for: Privacy and anonymous security research.

4. CAINE

CAINE is designed for computer forensics and incident-response investigations. It provides tools for evidence collection and forensic analysis.

Recommended for: Digital forensics and incident response.

5. REMnux

REMnux is specialized for reverse engineering and malware analysis.

Recommended for: Malware analysis and reverse engineering.

6. Security Onion

Security Onion is designed for defensive security, network monitoring, intrusion detection and threat hunting.

Recommended for: SOC operations and security monitoring.

OS Selection Guide

Cybersecurity Role	Best Distribution
Penetration Testing	Kali Linux
Ethical Hacking	Kali Linux/ Parrot Security
Privacy	Tails
Digital Forensics	CAINE
Malware Analysis	REMnux
Security Monitoring	Security Onion

3. Execute at least five Linux commands that produce both successful and unsuccessful results. Investigate their exit status using '\$?'.

Create a simple visual/table showing *Command → Result Exit Status → Meaning*.

What can a script learn from an exit status?

An exit status is a numerical value returned by a command after it finishes execution.

- 0 = Successful execution
- Non-zero value = Failure or another condition

The echo \$? contains the exit status of the most recently executed command.

Command	Result	Exit Status	Meaning
pwd	Shows current directory	0	Successful

echo "Hello"	Prints Hello	0	Successful
mkdir exit_demo	Creates directory	0	Successful
ls /folder_that_does_not_exist	Shows an error	2	Directory does not exist
cat missingfile.txt	Shows an error	1	File cannot be read

Demonstration:

1. Successful mkdir-

```
(kali㉿kali)-[~]
$ mkdir aansh

(kali㉿kali)-[~]
$ echo $?
0
```

Unsuccessful mkdir-

```
(kali㉿kali)-[~]
$ mkdir Music
mkdir: cannot create directory 'Music': File exists

(kali㉿kali)-[~]
$ echo $?
1
```

2. Successful ls-

```
(kali㉿kali)-[~]
$ ls
aansh Desktop Documents Downloads LinuxLab Music Pictures Projects Public Templates Videos

(kali㉿kali)-[~]
$ echo $?
0
```

Unsuccessful ls-

```
(kali㉿kali)-[~]
$ ls lab4
ls: cannot access 'lab4': No such file or directory

(kali㉿kali)-[~]
$ echo $?
2
```

3. Successful date-

```
(kali㉿kali)-[~]
$ date
Thu Aug 13 07:56:45 PM EDT 2026

(kali㉿kali)-[~]
$ echo $?
0
```

Unsuccessful date-

```
(kali㉿kali)-[~]  
$ date -d  
date: option requires an argument -- 'd'  
Try 'date --help' for more information.  
  
(kali㉿kali)-[~]  
$ echo $?  
1
```

4. Successful cd-

```
(kali㉿kali)-[~]  
$ cd aansh  
  
(kali㉿kali)-[~/aansh]  
$ echo $?  
0
```

Unsuccessful cd-

```
(kali㉿kali)-[~/aansh]  
$ cd aansh3  
cd: no such file or directory: aansh3  
  
(kali㉿kali)-[~/aansh]  
$ echo $?  
1
```

5. Successful touch-

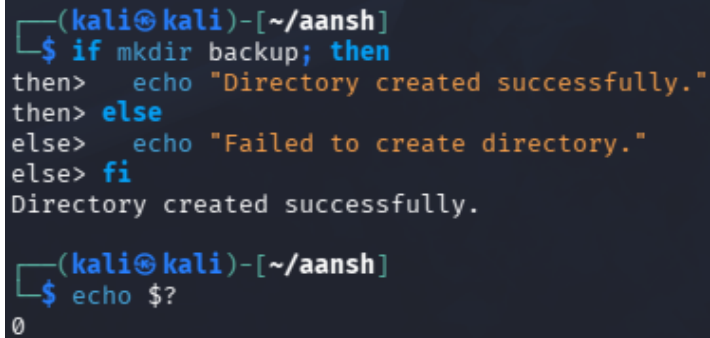

```
(kali㉿kali)-[~/aansh]  
$ touch file.txt  
  
(kali㉿kali)-[~/aansh]  
$ echo $?  
0
```

Unsuccessful touch-

```
(kali㉿kali)-[~/aansh]  
$ touch lab4/file.txt  
touch: cannot touch 'lab4/file.txt': No such file or directory  
  
(kali㉿kali)-[~/aansh]  
$ echo $?  
1
```

- What Can a Script Learn From an Exit Status?

A script can use exit status to determine whether a command succeeded or failed. It can then make decisions, handle errors, stop execution, continue execution, or display appropriate messages.

```
(kali㉿kali)-[~/aansh]
$ if mkdir backup; then
then>   echo "Directory created successfully."
then> else
else>   echo "Failed to create directory."
else> fi
Directory created successfully.

(kali㉿kali)-[~/aansh]
$ echo $?
0
```

In this, the script checks whether mkdir was successful and performs the appropriate action.
